

thirds of the marginal, and the anterior and apical two-thirds of the submarginal cells, from the latter it extends broadly on each side of the apical cross vein, fourth longitudinal and posterior cross vein slightly beyond the fifth longitudinal vein, it also extends inward along the fourth longitudinal and anterior cross vein, leaving only the central portion of the first posterior and the basal posterior half of the discal cell hyaline. Calypteres whitish margined with yellow. Length, 12 mm.

One specimen, Montreal Island, Canada, from Mr. G. Chagnon. Its large size and broad, maculated wings readily distinguish this species.

---

IDENTIFICATION OF SPECIMENS.—The Cambridge Entomological Club is prepared to undertake the identification of adult forms in all orders, free of charge, for paid-up subscribers to *PSYCHE*. The privilege of retaining specimens after identification, for insertion in the collection of the Boston Society of Natural History, is reserved. Each specimen submitted should therefore have a label bearing a number or other distinguishing mark, and the sender should keep a memorandum of these labels.

A DEPARTMENT OF BIBLIOGRAPHY will be instituted in the next number of *PSYCHE*. Brief references to current entomological literature will be presented. This department will hereafter be a regular feature of the journal.
